

TL5209 500-mA Low-Noise Low-Dropout Voltage Regulator With Shutdown

1 Features

- Adjustable Output Voltage
- 1%/2% Accuracy (25°C/Full Range)
- 500-mV (Maximum) Dropout at Full Load of 500 mA
- Tight Regulation Overtemperature Range
 - 0.1%/V (Maximum) Line Regulation
 - 0.7% (Maximum) Load Regulation
- Ultra Low-Noise Capability (300 nV/ $\sqrt{\text{Hz}}$ Typical)
- Shutdown Current of 3 μA (Maximum)
- Low Temperature Coefficient
- Current Limiting and Thermal Protection
- Stable With Minimum Load of 1 mA
- Reverse-Battery Protection
- Applications
 - Portable Applications (PDAs, Laptops, Cell Phones)
 - Consumer Electronics
 - Post-Regulation for SMPS
- Available in Convenient SOIC-8 Surface-Mount Package

2 Applications

- Set-Top Boxes
- PCs and Notebooks
- EPOS
- Building Automation

4 Typical Application Schematic

3 Description

The TL5209 device is 500-mA low-dropout (LDO) regulator that is well suited for portable applications. It has a lower quiescent current than most traditional PNP regulators and allows for a shutdown current of 0.05 μA (typical). The TL5209 also has very good dropout voltage characteristics, requiring a maximum dropout of 10 mV at light loads and 500 mV at full load. In addition, the LDO also has a 1% output voltage accuracy and very tight line and load regulation that is comparable to its CMOS counterparts.

For noise-sensitive applications, the TL5209 allows for low-noise capability through an external bypass capacitor connected to the BYP pin, which reduces the output noise of the regulator. Other features include current limiting, thermal shutdown, reverse-battery protection, and low temperature coefficient.

The TL5209 is available with adjustable output. Offered in an SOIC-8 surface-mount package, the TL5209 is characterized for operation over the virtual junction temperature ranges of -40°C to 125°C .

7.5 Electrical Characteristics

V_{IN} = V_{OUT} + 1 V, C_{OUT} = 4.7 μF, I_{OUT} = 1 mA, full range T_J = –40°C to 125°C

PARAMETER	TEST CONDITIONS	T _J	MIN	TYP	MAX	UNIT
Output voltage accuracy	V _{OUT} = 2.5 V for ADJ only	25°C	–1%		1%	
		–40°C to 125°C	–2%		2%	
αV _{OUT} Output voltage temperature coefficient		–40°C to 125°C		40		ppm/°C
Line regulation	V _{IN} = (V _{OUT} + 1 V) to 16 V	25°C		0.009	0.05	% / V
		–40°C to 125°C			0.1	
Load regulation	I _{OUT} = 1 mA to 500 mA ⁽¹⁾	25°C		0.05%	0.5%	
		–40°C to 125°C			0.7%	
V _{IN} – V _{OUT} Dropout voltage ⁽²⁾	I _{OUT} = 1 mA	25°C		45	60	mV
		–40°C to 125°C			80	
	I _{OUT} = 50 mA	25°C		115	175	
		–40°C to 125°C			250	
	I _{OUT} = 100 mA	25°C		150	250	
		–40°C to 125°C			300	
	I _{OUT} = 500 mA	25°C		350	500	
		–40°C to 125°C			600	
I _Q Quiescent current	V _{EN} ≥ 3 V, I _{OUT} = 1 mA	25°C		100	140	μA
		–40°C to 125°C			170	
	V _{EN} ≥ 3 V, I _{OUT} = 50 mA	25°C		350	650	
		–40°C to 125°C			900	
	V _{EN} ≥ 3 V, I _{OUT} = 100 mA	25°C		1.2	2	mA
		–40°C to 125°C			3	
	V _{EN} ≥ 3 V, I _{OUT} = 500 mA	25°C		8	20	
		–40°C to 125°C			25	
I _{min} Minimum load current ⁽³⁾		–40°C to 125°C			1	mA
I _{SD} Shutdown current	V _{EN} ≤ 0.4 V	25°C		0.05	3	μA
	V _{EN} ≤ 0.18 V	25°C		0.1		
		–40°C to 125°C			8	
Ripple rejection	f = 120 Hz	25°C		75		dB
I _{LIMIT} Current limit	V _{OUT} = 0 V	25°C		700	900	mA
		–40°C to 125°C			1000	

(1) Low duty cycle testing is used to maintain the junction temperature as close to the ambient temperature as possible. Changes in output voltage due to thermal effects are covered separately by the thermal regulation specification.

(2) Dropout is defined as the input to output differential at which the output drops 2% below its nominal value measured at 1-V differential.

(3) For stability across the input voltage and temperature. For ADJ versions, the minimum current can be set by R1 and R2.

Electrical Characteristics (continued)

$V_{IN} = V_{OUT} + 1\text{ V}$, $C_{OUT} = 4.7\text{ }\mu\text{F}$, $I_{OUT} = 1\text{ mA}$, full range $T_J = -40^\circ\text{C}$ to 125°C

PARAMETER	TEST CONDITIONS	T_J	MIN	TYP	MAX	UNIT
$\Delta V_{OUT}/\Delta P_D$ Thermal regulation ⁽⁴⁾	$V_{IN} = 16\text{ V}$, 500-mA load pulse for $t = 10\text{ ms}$	25°C		0.05		%/W
V_n Output noise	$V_{OUT} = 2.5\text{ V}$, $I_{OUT} = 50\text{ mA}$, $C_{OUT} = 2.2\text{ }\mu\text{F}$, $C_{BYP} = 0$	25°C		500		$\text{nV}/\sqrt{\text{Hz}}$
	$I_{OUT} = 50\text{ mA}$, $C_{OUT} = 2.2\text{ }\mu\text{F}$, $C_{BYP} = 470\text{ pF}$ ⁽⁵⁾	25°C		300		
V_{EN} Enable logic voltage	$V_{EN} = \text{logic LOW (shutdown)}$	25°C			0.4	V
		-40°C to 125°C			0.18	
	$V_{EN} = \text{logic HIGH (enabled)}$	25°C	2			
I_{EN} Enable input current	$V_{EN} \leq 0.4\text{ V}$ (shutdown)	25°C		0.01	-1	μA
	$V_{EN} \leq 0.18\text{ V}$ (shutdown)	-40°C to 125°C		0.01	-2	
	$V_{EN} \geq 2\text{ V}$ (enabled)	25°C		5	20	
		-40°C to 125°C			25	

(4) Thermal regulation is defined as the change in output voltage at a specified time after a change in power dissipation is applied, excluding line and load regulation effects.

(5) C_{BYP} is optional and connected to the BYP/ADJ pin.

8 Detailed Description

8.1 Overview

The TL5209 device is a low-dropout (LDO) regulator with an input voltage range from 2.5 V to 16 V and a maximum output current of 500 mA. The output voltage can be adjusted using external resistors (R1 and R2) and has an accuracy of 1% to 2% depending on the ambient temperature. The maximum voltage drop across the device varies from 10 mV to 500 mV depending on the current load at the output.

8.2 Functional Block Diagram

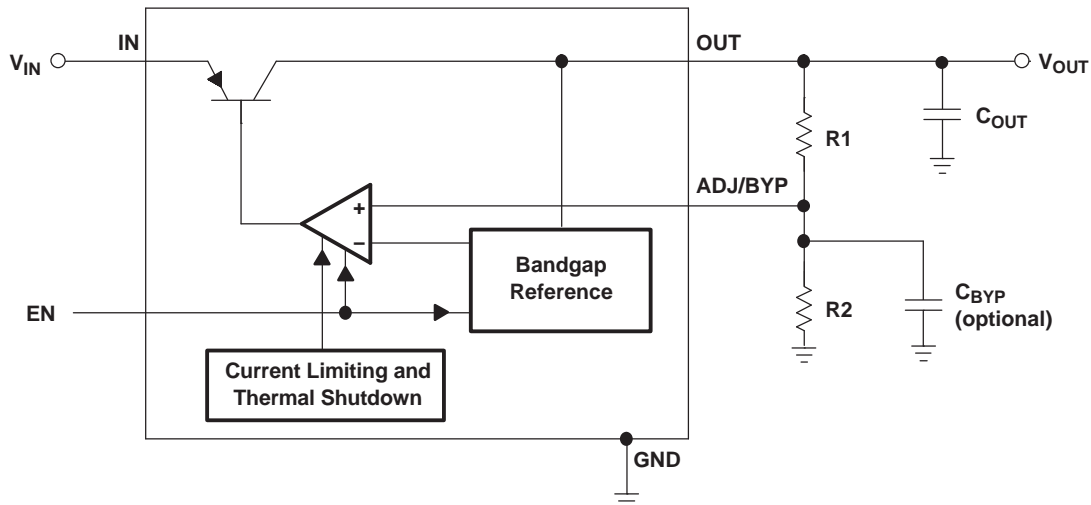

Figure 39. Low-Noise Adjustable Regulator

8.3 Feature Description

8.3.1 Enable and Shutdown

The EN pin is CMOS-logic compatible. When EN is held high (>2 V), the regulator is active. Likewise, applying a low signal (<0.4 V at 25°C) to EN or leaving it open shuts down the regulator. If the enable or shutdown feature is not needed, EN should be tied to VIN.

8.4 Device Functional Modes

The table below lists the expected value of V_{OUT} as determined by the EN pin.

Table 1. V_{OUT} Function Table

EN (Control Input)	V _{OUT}
L	Open
H	$1.242 \text{ V} \times (1 + R2/R1)$

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Low-Voltage Operation

When using the TL5209 in voltage-sensitive applications, special considerations are required. If appropriate output and bypass capacitors are not chosen properly, these devices may experience a temporary overshoot of their nominal voltages.

At start-up, the full input voltage is initially applied across the regulator pass transistor, causing it to be temporarily fully turned on. By contrast, the error amplifier and voltage-reference circuits, being powered from the output, are not powered up as fast. To slow down the output ramp and give the error amplifier time to respond, select larger values of output and bypass capacitors. The longer ramp time of the output allows the regulator enough time to respond and keeps the output from overshooting its nominal value.

To prevent an overshoot when starting up into a light load ($\neq 100 \mu\text{A}$), TI recommends 4.7- μF and 470-pF capacitors for the output and bypass capacitors, respectively. At higher loads, 10- μF and 470-pF capacitors should be used.

If the application is not very sensitive to regulator overshoot, both the output capacitor and bypass capacitor (if applicable) can be reduced.

9.2 Typical Application

- A. $V_{\text{OUT}} = 1.242 \text{ V} (1 + R2/R1)$
- B. $R2$ should be $\leq 470 \text{ k}\Omega$ for optimal performance.
- C. Maximum $V_{\text{OUT}} = 6.75 \text{ V} \pm 10\%$

Figure 40. TL5209 Typical Application

9.2.1 Design Requirements

For this design example, use the parameters listed in [Table 2](#) as the input parameters.

Table 2. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V_{IN}	5 V
$R1$	100 k Ω
Load current	500 mA
Desired V_{OUT}	3.3 V

9.2.2 Detailed Design Procedure

9.2.2.1 Setting the Output Voltage

The TL5209 develops a 1.242-V reference voltage, V_{REF} , between the output and the adjust terminal. As shown in Figure 40, this voltage is applied across resistor R1 to generate a constant current. The current I_{ADJ} from the ADJ terminal could introduce DC offset to the output. Because, this offset is very small (about 50 nA), it can be ignored. The constant current then flows through the output set resistor R2 and sets the output voltage to the desired level. Equation 1 is used for calculating VOUT:

$$V_{OUT} = 1.242 \text{ V} \times (1 + R_2 / R_1) \quad (1)$$

With an R1 resistance of 100 kΩ and a desired output voltage of 3.3 V, the value for R2 can be calculated:

$$3.3 \text{ V} = 1.242 \text{ V} \times (1 + R_2 / 100 \text{ k}\Omega) \quad (2)$$

$$100 \text{ k}\Omega \times ((3.3 \text{ V} / 1.242 \text{ V}) - 1) = R_2 \quad (3)$$

$$R_2 = 165.7 \text{ k}\Omega \quad (4)$$

Therefore, with an R2 resistance of 165.7 kΩ, the output voltage can be set to 3.3 V.

The TL5209 adjustable output should not be adjusted above $6.75 \text{ V} \pm 10\%$ due to the internal Zener diode clamping the output voltage above 6.75 V. Although I_{ADJ} is very small, R2 should be limited to less than 470 kΩ for optimum performance.

9.2.2.2 Input Capacitor

If the input of the regulator is located more than ten inches from the power-supply filter, or if a battery is used to power the regulator, TI recommends a minimum 1-μF input capacitor.

9.2.2.3 Output Capacitor

As with all PNP regulators, an output capacitor is needed for stability. The required minimum size of this output capacitor depends on several factors, one of which is whether a bypass capacitor is used.

- With no bypass capacitor, TI recommends a minimum C_{OUT} of 1 μF.
- With a bypass capacitor of 470 pF (see Figure 40), TI recommends a minimum C_{OUT} of 2.2 μF.
- Larger values of C_{OUT} are beneficial, because they improve the regulator transient response.

Another factor that can determine the minimum size of the output capacitor is the load current. At low loads, a smaller output capacitor is needed for stability.

The equivalent series resistance (ESR) of the output capacitor also can affect regulator stability. C_{OUT} should have an ESR of $\neq 1 \Omega$, and it should have a resonant frequency greater than 1 MHz. Too low of an ESR can cause the output to have a low-amplitude oscillation and/or underdamped transient response. Most tantalum or aluminum electrolytic capacitors can be used for the output capacitors. However, care must be taken at low temperatures, because aluminum electrolytics use electrolytes that can freeze at low temperature ($\neq -30^\circ\text{C}$). Solid tantalum capacitors do not exhibit this problem and should be used below -25°C .

9.2.2.4 Bypass Capacitor

An optional bypass capacitor, C_{BYP} , can be externally connected to the regulator through the BYP pin for improved noise performance. Connected to the internal voltage divider and the error amplifier of the regulator, this bypass capacitor filters the noise of the internal reference and reduces the noise effects on the error amplifier. The overall result is a significant drop in output noise of the regulator. TI recommends a 470-pF bypass capacitor.

Adding a bypass capacitor has several effects on the regulator that must be taken into account. First, the bypass capacitor reduces the phase margin of the regulator and, thus, the minimum C_{OUT} needs to be increased to 2.2 μF, as previously mentioned. Second, upon start-up of the regulator, the bypass capacitor has an effect on the regulator turnon time. If a slow ramp-up of the output is needed, larger values of C_{BYP} should be used. Conversely, if a fast ramp-up of the output is needed, use a smaller C_{BYP} or none at all.

If a bypass capacitor is not needed, BYP should be left open.

9.2.3 Application Curves

Figure 41 shows the expected output voltage versus R2 for various values of R1.

Figure 41. Expected Output Voltage vs R2 Resistance

10 Power Supply Recommendations

The device is designed to operate with an input voltage range of 2.5 V to 16 V. This supply must be well regulated and placed as close to the device terminals as possible. It must also be able to withstand all transient and load currents, using a recommended input capacitance of 1 μ F if necessary. If the supply is located more than a few inches from the device terminals, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of 10 μ F may be sufficient.

11 Layout

11.1 Layout Guidelines

For best performance, VIN, VOUT, and GND traces must be as short and wide as possible to help minimize the parasitic electrical effects. To be most effective, the input and output capacitors must be placed close to the device to minimize the effects that parasitic trace inductances may have on normal operation.

11.2 Layout Example

Figure 42. TL5209 Layout Schematic

12 Device and Documentation Support

12.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
TL5209DR	ACTIVE	SOIC	D	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	TL5209	Samples
TL5209DRG4	ACTIVE	SOIC	D	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 125	TL5209	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
